Astra HC-90

HYDRAULIC CRAWLER MOUNTED
Lifting capacity 90 Ton (Metric)

- ▶ Liftcane
- ▶ Dragline
- ▶ Grabcrane
- ▶ Foundation Crane

NCK PROVEN RELIABLE TECHNOLOGY

The ASTRA 90 model is an extension of the well proven NOVA range and can be used as a multi-purpose crawler crane for:- CONSTRUCTION - FOUNDATION - PORT HANDLING.

- The machine has a maximum lifting capacity of 90000 kg.
- Tandem drum shaft arrangement with hoist line speeds up to 108 metres per minute.
- Rated liftcane line pull is 12300 kg and the machine has the option available for line pulls up to 27500 kg for the foundation industry.
- The power unit is world proven Caterpillar, rated 240 kW (325 HP) at 2000 rpm.
- The machine is totally hydraulically driven and precisely controlled via low voltage control valves.
- The crawler unit is retractable to 3.5m wide, enabling the complete machine to be easily transported.

Crawler Units

Tracks: Independently driven by a bent axis piston motor through a triple reduction gearbox, incorporating a multi-disc brake. This mechanism provides for independent control to travel, steer or contra-rotation for maximum manoeuvrability. Hydraulic system also provides braking to prevent downhill movement.

Crawler Frames: Box section all welded construction, precision machined to accept drive gearbox and lower roller system. Drive sprocket, idler wheel and lower rollers are lifetime lubricated. Tension adjustment on track belt is provided hydraulically.

To ensure transportation within European Road Regulations crawler frames are provided with hydraulic cylinder to facilitate easy retractability.

Track Shoes: Heavy duty high tensile heat treated with abrasion resistant plate.

Carbody: High strength steel fabrication incorporating box section axle extensions to accept crawler frames. Forged steel top ring machined to accept bolt-on slew ring.

Power Unit

Caterpillar Model 3306B-DITA water cooled 4-stroke, 6-cylinder direct injected turbocharged industrial diesel engine.

Radiator and oil cooler, remote mounted, fan driven by hydraulic motor.

Turntable

Welded steel structure consisting of two fabricated beams as main longitudinal members connected by transverse beams and platework for strength and rigidity.

The structure is precision machined for hoist units, swing unit and lattice boom. The superstructure revolves on a totally enclosed anti-friction slewing ring.

Main and Auxiliary Hoist Units

Main and auxiliary hoist units are driven independently by slow speed, high torque radial piston motors. Rotational direction and speed is controlled through a single lever proportional valve for precise control of hoisting/lowering.

Drums: Main and auxiliary hoist drums are fabricated from rolled steel with cast steel flanges. Rope grooves are machined for controlled rope spooling.

Both drums are mounted on high strength alloy steel shafts which revolve on anti-friction bearings.

Clutches: Drum units are connected to the drive units through large diameter internal expanding friction bands, with replaceable linings. Clutches are spring set and power released.

Brakes: External contracting friction band type, spring applied and power released. Crane (fully powered operation) brakes are automatically released when hoist/lower direction is selected and fully applied with control lever in neutral. Cyclic operation (gravity lower) brake effort is precisely controlled by servo action foot pedals and together with synchronised clutch disconnect, provide excellent control for gravity lowering.

Swing Unit

NCK high specification swing system.

Completely independent of all other motions, swing pinion is driven by reversible high torque radial piston motor incorporating multi-disc brake. Spring applied and power released, hydraulic system provides for controlled braking.

Boom Hoist Unit

Hoist/lower unit is driven by a bent axis piston motor through a double reduction gearbox incorporating a multi-disc brake which is spring applied and power released. The brake is automatically released when main boom is hoisted or lowered and fully applied with control lever in neutral.

Hydraulic system provides for precise control of boom position. A mechanical pawl lock is provided on the boom hoist drum.

NCK Astra HC-90

Operators Cab

Modern ergonomically designed separate module, fully equipped with all necessary equipment for ease of control and operator comfort including all-round visibility, air conditioning unit and in-cab radio. Cab is also flexibly mounted and conforms to all European environmental regulations.

Machinery House

Steel constructed and noise insulated, covering the engine and all operating equipment. Easy access is available for all servicing.

Hydraulic System

Four hydraulic pumps driven via Splitter reduction gearbox.

Two variable displacement piston pumps (open circuit) for operation of travel, hoist drums and boom hoist. Simultaneous control or individually.

Single variable displacement piston pump (closed circuit) for independent control of swing motion.

Single gear pump for control of pilot circuit or ancillary equipment.

Main/auxiliary motors: Dual displacement radial piston type complete with counterbalance.

Boom hoist motor: Bent axis piston motor complete with counterbalance valve.

Swing motor: High torque radial piston motor.

Travel motor: Bent axis piston motor.

Hydraulic valves: Relief valves protect all motion and control circuits from overload. Main hoist winch and boom hoist circuits incorporate counterbalance valves to ensure safe controlled lowering.

Traction circuit also includes counterbalance valves to ensure safe travelling on inclines.

Front End Attachment

Tubular chord boom: Lattice construction, high tensile steel tubular chord.

Base boom:- two piece, total length 12 metres.

Lower section:- 6 metres

Outer section:- 6 metres

Boom point:- offset boom head, 5 sheaves mounted on anti-friction bearings.

Boom inserts:- 3m, 6m and 9m long. Pin joint connected to increase main boom length.

Fly Jib

Lattice construction, high tensile steel main chord members.

Basic jib:- two piece construction, total length 9 metres.

Jib inserts:- 4.5 metres long, pin joint connected (maximum length 18 metres).

Jib point:- single sheave mounted on anti-friction bearings.

Main Boom Suspension

Pendant suspension from suspension mast which is pin connected to lower superstructure.

Mast is hoisted and lowered on a multi-reeved rope system, located between the mast head and a fabricated frame at rear of turntable.

All sheaves are mounted on anti-friction bearings and suspension mast can be removed without unreeving the rope system.

Safety Equipment

Boom overhoist: Maximum boom angle is restricted to 80° by automatic cut-out, which neutralises the hoist valve and applies the brake.

Telescopic tubular backstops are also provided between main boom and superstructure.

Operators cab: Safety glass is fitted in all windows.

Counterbalance valve: To ensure machine fails safe in the event of an hydraulic failure, a brake valve is incorporated into the travel, boom hoist, main and auxiliary hoist circuits. This valve is automatically activated.

Rope position indicator: NCK-designed rope positioning device for accurate placement of loads.

Drum lock: Boom hoist drum is fitted with a safety pawl lock.

Brake system: To ensure maximum safety, all brakes are fail safe type, spring applied and power released.

Safe load indicator: An electronic audible and visible automatic safe load indicator is available for main boom and fly jib operations.

Indicator records the operating radius, suspended load (actual) and the safe working load. Management system can be incorporated with computer downloading facility.

The load sensing unit is incorporated into the boom hoist system, making it suitable for cyclic duty and foundation applications, in addition to normal liftcane loadings.

Noise

Noise emissions to comply with future European standards.

NCK Astra HC-90

BASIC SPECIFICATION

MAXIMUM RATED LOAD		90000 kg @ 4m Radius
Boom	Basic Boom Length	12 m
	Max Boom Length	60 m
	Fly Jib	9 - 13.5 - 18 m
	Maximum boom C/W Fly	48 m plus 18 m
Swing Speed (Variable)		0 - 2.7 RPM
Travel Speed (Two Speed Variable)		0 - 1.28 KPH
Gradeability		50% Low Speed
Power Unit	Model:	Caterpillar 3306B-DITA
	Rated Power	240kw (325 BHP) @ 2000 RPM
Operating Weight	Lifrcane Equipped with 12M Boom 90 Tonne Hook Block & Counterweight (18000 kg)	84750 kg

GRABCRANE -

If required for dockside application (Consult with Manufacturer). Winch Motors can be set for optimum Pull/Speed Ratio.

FOUNDATION -

Winch Drums to enable high line pull/speed for foundation application comply with BS EN791 and BS EN996 requirements.

LIFTCRANE -

Maximum line pull of 18000 kg can be obtained but is restricted to 12300 kg to comply with BS 1757:1986 rope factor of safety 4.5:1.

NCK Astra HC-90

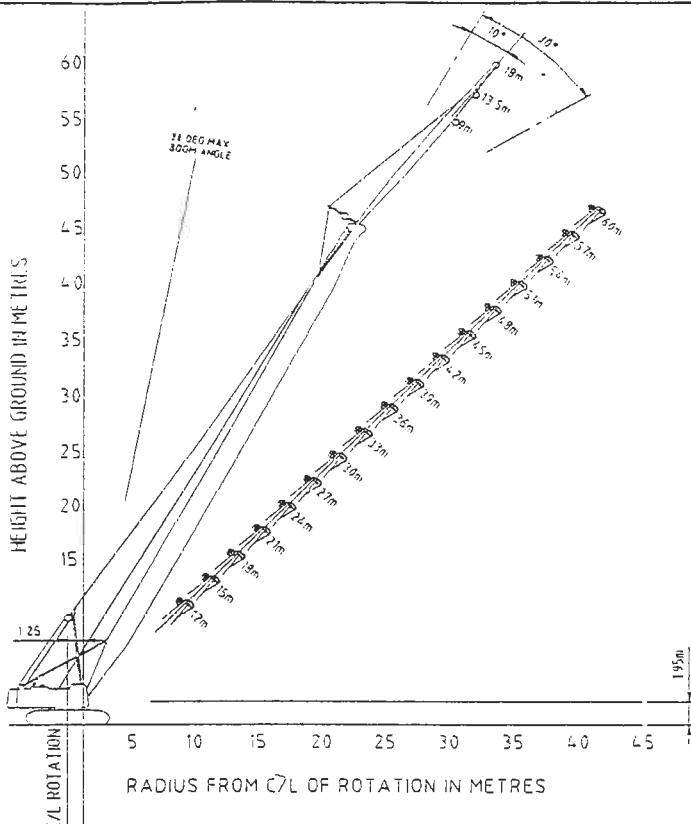

Offset Head Boom Radius Diagram

Users are referred to British Standards Code of Practice (CP 3010 : 1972) "Safe Use of Cranes", which gives guidance for the safe application and operation of mobile cranes.

The Gross Working Loads listed in the

duty tables are to be used under the following conditions:

Operating this equipment in excess of the rated loads shown in the following capacity charts or contrary to our Instruction Manual will result in unsafe conditions, damage to the machine and invalidate the warranty.

**L.S.O. 4305 : 1981 BS 1757 : 1986,
D.I.N. 15019 pt.2, Crane Ratings**
Capacities in accordance with the requirements of Clause 11, Stability of BS 1757:1986 with wind forces to Table 2(a) and 3(a) of BS 2573, Part 1: 1977 and also meet the Determination of Stability of International Standard ISO 4305, and Stability of Mobile Cranes DIN 15019 part 2.

Loads must be freely suspended and the machine standing on firm ground, level to less than 1 in 100.

Loads shown are gross and the weights of all hook blocks, slings, etc, must be deducted to determine nett working loads.

75% Crane Ratings

Rated loads do not exceed 75% of the tipping loads but in certain instances, are further governed by structural limitations.

Ratings are based on freely suspended loads and make no allowance for such factors as wind effects, ground conditions, out of level, operating speeds or any other conditions that could be detrimental to the safe operation of this equipment.

Loads shown are gross and the weights of all hook blocks, slings, etc, must be deducted to determine nett working loads.

Main Boom Loads

Main boom loads with offset head - maximum capacity 90000 kg, maximum length 60.0 m.

When a fly jib is fitted, the effective weight of all hook blocks, slings, etc, must be deducted when calculating nett working loads. The main boom loads must be further reduced by the following to allow for the weight of the fly jib:

9 m Fly Jib - reduce by 1200 kg
13.5 m Fly Jib - reduce by 1500 kg
18 m Fly Jib - reduce by 2000 kg

Maximum length of main boom when fly jib is fitted - 51 m with 9 m or 13.5 m fly and 48 m with 18 m fly

Fly Jib Loads

Maximum fly jib gross loads: (see Duty Chart)

9 m Fly Jib - 10000 kg
13.5 m Fly Jib - 9000 kg
18 m Fly Jib - 6000 kg

Effective weight of all suspended hook blocks, slings and tackle must be deducted when calculating nett working loads.

Fly Jib Offset

With the standard pendant ropes supplied for each fly jib, the offset of the fly jib head from the centre line of the main boom is 10° or 30°, regardless of the fly jib length. This offset angle must be maintained at all times.

Liftcrane Hoist Rope Loads

26 mm rope

No. of Parts of Rope	Max. Lifting Capacity (kg)
1	12300
2	24400
3	36200
4	47900
5	59200
6	70400
7	81400
8	90000

The above capacities are derived from rope factors of safety to BS 1757 : 1986, also in accordance with P.C.S.A. Standard No. 1 and maximum pulls from hoist drums.
