DIMENSIONS AND WORKING RANGES

Rubber Tired Mounting — 8 x 4, 11' 1" Wide		
Basic angle boom length	A	40' 0"
Basic tubular boom length	A	40' 0"
Boom angle	B	—
Over-all height, top of roller path mounting plate	M	4' 7"
Ground clearance under counterweight "A"	N	5' 2"
Ground clearance under counterweight "AB"	N ₁	5' 1"
Centerline rotation to center rear axle bogie pivot	O	4' 0"
Centerline rotation to center rear outrigger	O ₁	9' 3"
Center rear rear axle to center rear outrigger	O ₂	3' 1"
Center front front axle to center front outrigger	O ₃	3' 3"
Centerline rotation to center front outrigger	O ₄	11' 11"
Over-all cab height	P	12' 2"
Over-all height, retractable gantry lowered	P ₂	13' 1"
Over-all height, retractable gantry raised	P ₃	16' 4"
Height over vertical boom live mast	P ₄	27' 6"
Height over boom live mast—with mast in position 30° above horizontal	P ₅	18' 7"
Ground clearance under outrigger box	Q	13 1/4"
Wheelbase (126")	R	10' 6"
Over-all length over outrigger boxes	S	22' 6"
Center rear axles to center rear axle bogie pivot	T ₁ & T ₂	2' 3"
Center front axles to center front axle bogie pivot	T ₃ & T ₄	2' 3"
Center front front axle to front outrigger	T ₅	3' 11"
Tailswing of counterweight "A"	U	11' 5"
Tailswing of counterweight "AB"	U ₁	11' 10"
Radius of boom hinge pin — angle boom	X	3' 2"
Radius of boom hinge pin — tubular boom	X	4' 1"
Height of boom hinge pin — angle boom	Y	6' 10"
Height of boom hinge pin — tubular boom	Y	5' 5"
Over-all cab width (without ladder to roof)	—	8' 0"
Over-all width — outriggers retracted, floats removed	—	11' 1"
Over-all width — outriggers extended (C/L of jacks)	—	18' 5"
Minimum ground clearance	—	1' 1"
Gradeability, low gear (based on peak engine torque)	—	24.21%

GENERAL INFORMATION ONLY

GENERAL SPECIFICATIONS

CARRIER

TYPE — Self-propelled type, 8 x 4, Link-Belt Speeder.

FRAME — Box section, wide flange beam main members; all-welded, stress relieved.

ROLLER PATH — Machined, double-flanged hook roller path — with integral internal ring (swing) gear — is welded to carrier frame.

CENTERPIN — Cast steel, welded to carrier frame.

FRONT AXLES — Front and rear front axles; Shuler FTCA-34-L (FE-15H) tandem, single wheels. Hendrickson rubber-mounted equalizing beams with torque rods. 104" track.

REAR AXLES — Front and rear rear axles; Clark Planetary #BD-57000, ratio 8.67:1, dual wheels, 100⁵/₈" track. Hendrickson bronze bushed equalizing beams and rubber-mounted torque rods.

WHEELS AND RIMS — Front; cast spoke. Rear; integral with planetary hubs. 9:00V — 24" rims.

TIRES — Standard; 14:00 x 24-L (20-ply rating) military type non-directional tread. Single tires on front axles; dual tires on rear axles.

BRAKES —

Service — Eight-wheel hydraulic brakes, Speed-o-Matic operated.

Size and Area —

Rear wheels — 16¹/₂" x 7"; total effective lining area, 920 sq. in.

Front wheels — 17¹/₄" x 4"; total effective lining area, 496 sq. in.

Digging — Eight-wheel service brakes.

Parking — Bendix internal expanding, 2-shoe type; spring applied and hydraulically released. Mounted on 2-speed transmission case.

Emergency — Parking brake can be used.

STEERING — Power hydraulic; double-acting cylinder, operated from Speed-o-Matic power hydraulic system.

TURNING RADIUS — 33' 0" to centerline of tire; 36' 0" over front corner.

TRANSMISSIONS —

Main — Link-Belt Speeder; 2-speed hydraulic shift. Gear ratios 1.00 to 1.00 and .296 to 1.00.

Overdrive — Link-Belt Speeder; gear ratio .483 to 1.00.

UNIVERSALS — Mechanics Universal or Rockwell Std.

DRIVING METHOD — Power is transmitted from the revolving crane upper to the carrier drive train through vertical travel shaft into a set of bevel gears with an overdrive ratio which, in turn, drives the main 2-speed transmission.

TRAVEL SPEEDS — All speeds shown are based on engine full load r.p.m. except low speed which is based on engine peak torque r.p.m.

Low — .78 m.p.h.

Second — 2.80 m.p.h.

Third — 4.10 m.p.h.

Fourth — 9.10 m.p.h.

GENERAL INFORMATION ONLY

OUTRIGGERS — Removable bolt-on outrigger boxes front and rear. Two alloy steel sliding beams per box.

Standard — Four ground controlled power hydraulic beams and jacks.

Optional — Manual sliding beams and screw jacks.

FLOATS — Low profile, steel, 26" square base.

FENDERS — Standard; removable.

UPPER

UPPER FRAME — All-welded, stress relieved, precision machined. Machinery side housings bolted to upper frame.

TURNTABLE ROLLERS — Eight adjustable, heat-treated, conical, hook-type steel rollers mounted on anti-friction bearings. Two equalized pairs mounted both front and rear.

TRANSMISSION — Link-Belt triple-width roller chain enclosed in oil-tight chain case with integral oil sump. Pump-driven oil stream lubrication. Engine pinion and chain wheel have machine-cut teeth.

REDUCTION SHAFT — Two piece shaft joined by an involute splined coupling and mounted on anti-friction bearings.

Drive Pinions — Two; heat treated, machine-cut teeth, involute splined to reduction shaft. Pinions mounted outside side housings.

CLUTCHES — Speed-o-Matic power hydraulic actuated for swing, hoist and power load lowering on front and rear main operating drums, boomhoist and lowering, and third operating drum. Internal expanding 2-shoe type, aluminum alloy shoes; 20" diameter, 5" face width. Optional third drum clutch; 17¹/₄" diameter, 4" face width. Note: Power load lowering clutches on front and rear main operating drums not available when machine is equipped with optional 2-speed gear-driven drums. Power load lowering clutch on rear main operating drum not available when drum is equipped with optional 2-shoe auxiliary drum brake.

Clutch Spiders — Involute splined to horizontal shafts.

DRUMS — Front and rear main operating, and optional third drums.

Shafts — Mounted in line bores on anti-friction bearings. Front and rear main operating drum shafts only — extended to accommodate power load lowering clutches. Special front and rear main operating drum shafts — required to accommodate optional 2-speed, gear-driven mechanisms or planetary drive units on either drum shaft.

Spur Gears — Machine-cut teeth; mounted on anti-friction bearings on shaft.

Clutch Drums — Bolted to spur gears.

Brakes — Two-piece, external contracting band, mechanically foot pedal operated.

Front and rear drums — 27" diameter, 4" face width. Optional third drum — 18" diameter, 3" face width.

Brake Drums — Involute splined to drum shafts.

Drum Laggings — Two-piece, removable; bolted to brake drum and on shaft.

THIRD DRUM — Optional; mounts forward of front main operating drum. Functions as third operating drum with design and control similar to front and rear main operating drums. On machine equipped with third drum, the following must be noted:

Dragline Operation — To avoid interference with inhaul rope, remove all cable from third drum. To prevent interference of dragline inhaul rope with third drum brake enclosure, use 10' longer inhaul rope than normal to leave minimum of 4 wraps of rope at anchor end of front (inhaul) drum.

Crane-Clamshell Operation — Quantity of third drum wire rope must be limited in some cases to avoid interference with front drum wire rope, particularly when operating booms at extended radii.

DRUM ROTATION INDICATORS — Standard for front and rear main operating drums. Mounted on front of control stand; dials are actuated by flexible shaft drives attached to drum shafts.

TWO-SPEED FRONT AND REAR MAIN OPERATING DRUMS — Gear-driven; optional for hoist only. Intermediate gears installed in side housings convert 2-shoe power load lowering clutches to high-speed hoist clutches; load hoist wire rope speed increased 90% over standard rope speed. Note: Power load lowering clutches, or optional auxiliary rear drum brake, not available with 2-speed, gear-driven drum arrangement.

PLANETARY DRIVE UNITS — Optional for front and rear main operating drums. Planetary unit mounts between spur gear and 2-shoe clutch drum on extended shaft; available for 70% increase or 40% decrease over standard wire rope speeds for load hoisting or lowering on rear drum, and for load hoisting only on front drum. Two-shoe clutches give standard wire rope speed. Planetary drive units controlled by external contracting band through push-button located on clutch control lever.

AUXILIARY TWO-SHOE REAR DRUM BRAKE — Optional. Internal expanding, 2-shoe Speed-o-Matic power hydraulic brake; 20" diameter, 5" face width. Brake spider involute splined to shaft and brake drum bolted to anchor plate on machinery side housing. Increases brake lining contact area by 212 sq. in. Pressure on mechanical brake pedal applies the standard rear drum brake and the auxiliary 2-shoe brake simultaneously. Mechanical linkage activates the control mechanism of a variable pressure valve to direct hydraulic pressure to the auxiliary brake cylinder. Note: The following items are not available for the rear drum when auxiliary brake is furnished — power load lowering clutch; 2-speed, gear-driven drum mechanism, or planetary drive unit for load lowering.

INDEPENDENT BOOMHOIST — Spur gear driven with precision boom raising or lowering through power hydraulic clutches. A wire rope drum locking pawl, manually

controlled from operator's position, is provided.

Shaft — Mounted in line bore on anti-friction bearings.

Spur Gears — Machine-cut teeth; mounted on anti-friction bearings on shaft.

Wire Rope Drum — Involute splined to shaft; boomhoist brake drum cast integral with wire rope drum.

Brake — External contracting band; 22" diameter, 3" face width. Spring applied and Speed-o-Matic power hydraulic released.

Boomhoist Limiting Device — Device designed to be mechanically adjusted to predetermined minimum boom radius. When boom is raised to this minimum radius, it contacts the limit stop which, in turn, mechanically "kicks out" boomhoist lever which disengages boomhoist clutch while the boomhoist brake is being automatically spring-applied. Boom must then be lowered before it can be raised again.

INDEPENDENT SWING AND TWO-SPEED TRAVEL — Standard.

HORIZONTAL SWING (REVERSE) SHAFT — Mounted in line bore on anti-friction bearings.

Spur Gears — Machine-cut teeth, mounted on anti-friction bearings on shaft.

Bevel Gear — Involute splined to shaft, fully enclosed and running in oil.

VERTICAL DRIVE SHAFT — For swing. Mounted on anti-friction bearings.

Spur Gear — Machine-cut teeth, involute splined to shaft, fully enclosed and running in oil.

Bevel Gear — Involute splined to shaft, fully enclosed and running in oil.

VERTICAL SWING SHAFT — Mounted on anti-friction bearings.

Spur Gear — Machine-cut teeth, involute splined to shaft, fully enclosed and running in oil.

Swing Pinion — Machine-cut teeth, involute splined to shaft; meshes with internal teeth of ring gear.

HORIZONTAL TRAVEL (REVERSE) SHAFT — Mounted in line bore on anti-friction bearings.

Spur Gears — Machine-cut teeth, mounted on anti-friction bearings on shaft.

Bevel Gear — Involute splined to shaft, fully enclosed and running in oil.

VERTICAL DRIVE SHAFT — For travel. Mounted on anti-friction bearings.

Spur Gear — For high-speed travel. Machine-cut teeth, mounted on bronze bushings, fully enclosed and running in oil.

Spur Gear — For low-speed travel. Machine-cut teeth, involute splined to shaft, fully enclosed and running in oil.

Jaw Clutch — Involute splined to shaft.

VERTICAL TRAVEL SHAFT — Two-piece, tubular steel; joined by splined sleeve. Both portions of shaft mounted on anti-friction bearings.

GENERAL INFORMATION ONLY

Spur Gear — Machine-cut teeth, involute splined to shaft, fully enclosed and running in oil.

Bevel Gear — Involute splined to shaft, fully enclosed and running in oil.

NON-INDEPENDENT SWING AND TWO-SPEED TRAVEL
— Optional.

HORIZONTAL SWING AND TRAVEL (REVERSE)

SHAFT — One reverse shaft serves both non-independent swing and travel.

Spur Gears and Bevel Gear — Same as for independent swing.

VERTICAL DRIVE SHAFT — For non-independent swing and travel. Mounted on anti-friction bearings.

Spur Gear — For high-speed travel. Machine-cut teeth, mounted on bronze bushings, fully enclosed and running in oil.

Spur Gear — For low-speed travel. Machine-cut teeth, involute splined to shaft, fully enclosed and running in oil.

Jaw Clutch — Involute splined to shaft.

VERTICAL SWING SHAFT — Mounted on anti-friction bearings.

Spur Gear — Machine-cut teeth, mounted on bronze bushings; engaged by jaw clutch on vertical drive shaft. Fully enclosed and running in oil. Machined clutch jaws integral with top side of gear.

Jaw Clutch — Involute splined to shaft, mounted on top side of spur gear, fully enclosed and running in oil.

Swing Pinion — Same as for independent swing.

VERTICAL TRAVEL SHAFT — Same as for independent swing.

Spur Gear — For low-speed travel. Machine-cut teeth, mounted on bronze bushings, machined clutch jaws integral with top side of gear, fully enclosed and running in oil.

Spur Gear — For high-speed travel. Machine-cut teeth, involute splined to shaft, machined clutch jaws integral with top side of gear, fully enclosed and running in oil.

Bevel Gear — Same as for independent swing.

SWING LOCK — Double-pawl type, mounted on inside front of upper frame. Mechanically operated from crane operator's position; engages internal teeth of ring gear.

SWING BRAKE — Two-directional, external contracting

band type; spring-applied and power hydraulically released. Mounted on vertical swing shaft.

GANTRY — Retractable type, mounted at rear of upper frame and cab; supports boom suspension system, bail, and two boomhoist wire rope guide sheaves. Also used for power lowering of counterweight in conjunction with boom lowering clutch.

Bail — Pinned to gantry frame. Contains five or six sheaves on bronze bushings for standard 10-part or optional 12-part boomhoist wire rope.

COUNTERWEIGHT — Standard counterweight "A" — 13,000# for crane, dragline, clamshell and magnet capacities. Optional additional 6,200# counterweight for lifting crane service only. Counterweight "AB" — 19,200# (one piece) for lifting crane service only.

CAB — Operator's door and front window and two rear doors roll on ball bearing rollers; other machinery access doors are hinged. Full-vision operator's compartment with safety glass panels. Foot throttle, hand throttle, fire extinguisher, signal horn, roof-top access ladder, hand grab rails, skid-resistant paint on roof — standard.

Cab Options — 4' elevated operator's cab, electric windshield wiper, heater and defroster fan, rigid catwalks for left and/or right side with overhead grab rails, and lever-type hand throttle on swing control lever.

CONTROL SYSTEM — Speed-o-Matic power hydraulics, an open system. Operating pressure is transmitted through oil to all operating 2-shoe clutch cylinders, swing brake and boomhoist drum, and brake cylinders. The system includes a pump to provide a constant flow of oil, an accumulator to maintain operating pressure, and variable pressure operator-controlled valves to regulate this pressure to each clutch cylinder.

Pump — Vickers; rated at 5 gal. per minute at 1,200 r.p.m.

Oil Filter — Link-Belt Speeder; replaceable Skinner ribbon-type filter element.

Relief Valve — Link-Belt Speeder; set to operate at 1,250 p.s.i.

Unloader Valve — Link-Belt Speeder; set to unload pump at a maximum of 1,050 p.s.i. and to load pump when pressure drops below 900 p.s.i.

Accumulator — Link-Belt Speeder; piston-type, pre-charged with nitrogen gas to 650 p.s.i.

Sump Tank — Link-Belt Speeder; 7-gal. capacity with filter and strainer assembly to keep oil clean.

Control Valves — Link-Belt Speeder; variable pressure type.

GENERAL INFORMATION ONLY

ENGINES — Diesel, 12-volt alternator, full-pressure lubrication, oil filter, radiator, air cleaner, hydraulic pump, and foot throttle.

CRANE BOOMS & JIBS

BOOM — Angle; 2-piece 40' basic length, 20' long base and open throat top section, 34" deep and 34" wide at connections. Main chord angles — base section, 3 1/2" x 3 1/2" x 3/8"; top section — 3 1/2" x 3 1/2" x 5/8".

Boomfoot — 1 5/8" thick on 38" centers; 3" diameter pin.

Boompint Machinery — Standard, 3 sheaves; optional, 2 or 4 sheaves. Sheaves mounted on anti-friction bearings.

Boompint Sheave Guards — Standard, rigid steel. Optional, roller-type mounted on anti-friction bearings does not permit use of center sheave(s) and not available on boom equipped with jib.

Boom Connections — Pin connections, standard; bolted, optional.

BOOM EXTENSIONS — Available in 5', 10' and 20' lengths with appropriate length pendants.

BOOM STOPS — Dual; rigid type, with spring-loaded bumper ends.

HOIST ROPE DEFLECTOR ROLLERS — To deflect main load hoist rope over top side of boom; mounted on anti-friction bearings. Required when optional third drum load hoist rope passes over crane boom, and recommended for machine equipped with long boom or machine working with short boom when front drum wire rope is used as main load hoist line. One roller standard; recommended options — 2 for booms 50'-65' long, 3 for booms 70'-85' long, and 4 for booms 90'-100' long.

BOOMHOIST BRIDLE — Serves as connection between the pendants and boomhoist rope. Bridle contains 5 or 6 sheaves mounted on bronze bushings, for standard 10-part or optional 12-part boomhoist wire rope.

JIB — Angle; 20' 2-piece with 10' long upper and lower sections; 10' extensions available to make up 30' and 40' jibs. Jib is 18" deep and 23" wide at connections; chord angles — lower section, 2" x 2" x 1/4"; upper section, 2" x 2" x 3/8". Bolted connections.

Jib Mast — 10' high, mounted on jib base section;

two deflector sheaves for the jib load hoist rope (whipline) mounted on anti-friction bearings within mast. Two equalizer sheaves mounted at top of mast for jib frontstay and backstay lines.

Jib Stops — Dual, telescoping type; pinned from jib mast to jib lower section and from jib mast to boom top section.

Jib Peak Sheave — Mounted on anti-friction bearings.

Jib Peak Shaft — Anchor is provided at peak of jib for 2-part jib load hoist rope, if desired.

BOOM — Hi-Lite tubular; 2-piece 40' basic length; 20' long base and open throat top sections, 44" deep and 44" wide at connections. Main chord angles — 2 1/4" square tube.

Boomfoot — 2 1/4" thick on 50" centers; 3" diameter pin.

Boompint Machinery — Standard, 3 sheaves; optional, 2 or 4 sheaves. Sheaves mounted on anti-friction bearings.

Boompint Sheave Guards — Standard, rigid steel. Optional, roller-type mounted on anti-friction bearings — does not permit use of center sheave(s) and not available on boom equipped with jib.

Boom Connections — Pin connections standard.

BOOM EXTENSIONS — Available in 10', 15' and 20' lengths with appropriate length pendants.

BOOM STOPS — Dual, telescoping type, with spring-loaded bumper ends.

HOIST ROPE DEFLECTOR ROLLERS — To deflect main load hoist rope over top side of boom; mounted on anti-friction bearings. Required when optional third drum load hoist rope passes over crane boom, and recommended for machine equipped with long boom or machine working with short boom when front drum wire rope is used as main load hoist line. One roller standard; recommended options — two for booms 110'-125' long, three for booms 130'-145' long, and four for booms 150' long.

BOOMHOIST BRIDLE — Serves as connection between the pendants and boomhoist rope.

GENERAL INFORMATION ONLY

WIRE ROPE

APPLICATION — TYPE AND SIZE USED

- Boomhoist** — Type "N", 5/8" dia.
- Main Load Hoist** — Type "N", 3/4" dia.
- Jib Load Hoist** — 1-part line, Type "K", 5/8" dia.; 2-part line, Type "N", 5/8" dia.
- Jib Staylines** — Type "A", 5/8" dia.; Type "F", 5/8" dia.
- Boom Pendants** — Type "N", 1 1/4" dia.
- Dragline Inhaul** — Type "D", 7/8" dia.
- Dragline Hoist** — Type "N", 3/4" dia.
- Clamshell Holding (Hoist)** — Type "N", 5/8" dia.
- Clamshell Closing** — Type "N", 5/8" dia.
- Midpoint Boom Suspension Pendants — (With Live Boom Mast)** — Type "C", 1" dia.

WIRE ROPE TYPES —

- Type "A"** — 6 x 25 (6 x 19 Class), filler wire, improved plow steel, preformed, fiber center, right lay, regular lay.
- Type "C"** — 6 x 25 (6 x 19 Class), filler wire, improved plow steel, preformed, independent wire rope center, right lay, regular lay.
- Type "D"** — 6 x 25 (6 x 19 Class), filler wire, improved plow steel, preformed, independent wire rope center, right lay, lang lay.
- Type "F"** — 6 x 25 (6 x 19 Class), filler wire, improved plow steel, preformed, independent wire rope center, right lay, regular lay.
- Type "K"** — 19 x 7 non-rotating, improved plow steel, preformed, wire rope center core.
- Type "N"** — 6 x 25 (6 x 19 Class), filler wire, extra improved plow steel, preformed, independent wire rope center, right lay, regular lay.

JIB MAST STAYLINES —

- Frontstay Pendants** — Attached from jib peak to top of jib mast.
- Backstay Pendants** — Attached from top of jib mast to base of boom top section.

Without Boom Live Mast — Bridle contains five or six sheaves, mounted on anti-friction bearings for standard 10-part or optional 12-part boomhoist wire rope.
With Boom Live Mast — Bridle contains six sheaves for standard 12-part boomhoist wire rope and two additional auxiliary sheaves to permit use of mast as short boom. All sheaves mounted on anti-friction bearings.

BOOM LIVE MAST — Hydraulic telescoping type. Boom live mast and boom midpoint suspension pendants required for Hi-Lite tubular booms over 130' long. Mounted on boomfoot adaptor; supports boomhoist bridle and boom midpoint suspension pendants.

JIB — Tubular; 20' 2-piece with 10' long upper and lower sections; 10' extensions available to make up 30', 40', or 50' jibs. Jib is 25 1/4" wide and 19 1/4" deep at connections; chord angles — upper and lower section, 1 1/4" round tube. Pin connections.

Jib Mast — 10' high, mounted on jib base section, two deflector sheaves for the jib load hoist rope (whipline) mounted on anti-friction bearings within mast. Two equalizer sheaves mounted at top of mast for jib frontstay and backstay lines.

Jib Stops — Dual, telescoping type; pinned from jib mast to jib lower section and from jib mast to boom top section.

Jib Peak Sheave — Mounted on anti-friction bearings.

Jib Peak Shaft — Anchor is provided at peak of jib for 2-part jib load hoist rope, if desired.

AUXILIARY EQUIPMENT

FAIRLEADER — Full-revolving type with barrel, sheaves, and guide rollers mounted on anti-friction bearings. (Standard with dragline attachment.)

TAGLINE WINDER — Optional. Rud-O-Matic Model 648; spring-wound drum type mounted on crane boom. Cable pull off drum — 60' — 75' from neutral.

BOOM ANGLE INDICATOR — Mounted on boom near base — standard.

MAXIMUM BOOM AND BOOM/JIB MACHINE CAN PICK, OR TRAVEL WITH, UNASSISTED — WITHOUT LOAD

Std. Upper Machinery Mounted on Std. Link-Belt Speeder 8 x 4 Drive Self-propelled Carrier	34" Angle Boom ②		Hi-Lite Tubular Boom ②	
	Ctwt. "A"	Ctwt. "AB"	Ctwt. "A"	Ctwt. "AB"
Maximum boom machine can pick clear of ground over rear and travel ① with —	100'	100'	90'	110'
Maximum boom plus jib machine can pick clear of ground over rear and travel ① with —	80' + 40'	90' + 30'	80' + 30'	90' + 30'
Maximum boom machine can pick clear of ground on outriggers — over rear over side	100' 100'	100' 100'	150' 140'	150' 150'
Maximum boom plus jib machine can pick clear of ground on outriggers — over rear over side	100' + 40' 100' + 40'	100' + 40' 100' + 40'	120' + 50' 120' + 40'	140' + 40' 140' + 30'

① Reduced travel speeds are recommended for travel with maximum boom and boom/jib, and safe speeds are dependent on condition of supporting surface.
 ② Boom with open throat top section.

GENERAL INFORMATION ONLY

JIB CAPACITIES — Pounds

Jib Angle To Ground	Angle or Tubular Jib			Tubular Jib Only
	20'	30'	40'(A)	50'(B)
80°	12,000	10,000	8,000	6,000
65°	10,000	8,000	6,000	4,000
50°	8,000	6,000	4,000	3,000
35°	7,500	5,500	3,500	2,000
20°	7,500	5,500	3,500	2,000

- Capacities shown are in pounds and are based on a Link-Belt Speeder angle jib 22 3/4" wide by 18" deep at connections or Link-Belt Speeder tubular jib 24" wide by 24" deep at connections. Either jib must be used with its 10' 0" high jib mast in proper working position.
 - 40' tubular jib at 30° off centerline of boom not recommended for booms over 130' long.
 - 50' tubular jib at 30° off centerline of boom not recommended and 50' tubular jib at 15° off centerline of boom not recommended for booms over 130'.
- To determine jib angle to ground, deduct jib angle to boom from the boom angle to ground.
- The jib angle to boom must not exceed 30°.
- Jib backstay line for either angle or tubular jib is anchored at base of boom top section.
- Determining jib capacities —
 - Add length of boom plus length of jib used.
 - Determine jib load radius.
 - Refer to lifting crane capacity table and select boom length that corresponds to the total length of boom and jib in (5-a) and the radius in (5-b).
 - Jib capacity is equal to the equivalent crane lifting capacity unless restricted by the maximum jib capacities shown in the above chart.
 - If total length of boom and jib exceeds the longest boom lengths shown on the crane lifting capacity tables, deduct the following from the capacity shown for the longest boom length for the radius required in (5-b).
 - 200# for tubular jib or 300# for angle jib.
 - Jib capacity is the resulting net figure unless restricted by the maximum jib capacities shown on the above chart.
- Determining crane lifting capacities with jib mounted on boom.
 - When operating off the main boom peak sheaves with a jib on the boom, the following reductions from the crane lifting capacity table must be made:
 - Angle or tubular jibs — 20' long, deduct 1,600#.
 - Angle or tubular jibs — 30' long, deduct 1,900#.
 - Angle or tubular jibs — 40' long, deduct 2,200#.
 - Tubular jib only — 50' long, deduct 2,500#.

⊙ Measured from center of boom head sheave to ground — machine standing on tires.

Notes — lifting crane capacities

- The capacities included in this chart are the maximum allowable, and are based on machine standing level on firm supporting surface under ideal job conditions.
- Capacities are based on 85% of minimum tipping loads unless marked with an asterisk.
 - Asterisk (*) based on factors other than those which would cause a tipping condition.
- Capacities are based on freely suspended loads and make no allowance for such factors as the effect of wind, sudden stopping of loads, supporting surface conditions, inflation of tires, and operating speeds. Operator must reduce load ratings to take such conditions into account. Deduction from rated capacities must be made for weight of jib, hook block, weighted ball/hook, sling, spreader bar, or other suspended gear.
- Retractable high gantry must be fixed in raised position for all capacities on this chart.
- Boom live mast, fixed in extended 20' 6" (6.25 m) position, required for boom lengths exceeding 130' (39.62 m).
- Boom midpoint suspension pendants required for boom lengths exceeding 130' (39.62 m).
- When using live mast as short boom, maximum lifting capacity of the mast in the extended position is 26,000# (11 794 kg) — on outriggers over side or rear — at radii from 9' 5" (2.87 m) minimum to 20' (6.10 m) maximum.
- For lifting 90,000# (40 824 kg), 6-part load hoist line (3/4" — 19 mm, Type "N" wire rope) is required. Check parts of line required for all capacities.
- Least stable rated condition is over the side.
- Main boom lengths without jib, must not exceed 150' (45.72 m). Maximum jib length permitted — 50' (15.24 m); maximum boom/jib combination permitted — 150' (45.72 m) boom plus 50' (15.24 m) jib.
- Determining lifting crane capacities with jib mounted on boom:
 - When handling load off main boom peak sheaves, the following reductions in rated lifting crane capacities must be made to compensate for jib weight:
 - 20' (6.10 m) jib — 1,600# (726 kg)
 - 30' (9.14 m) jib — 1,900# (862 kg)
 - 40' (12.19 m) jib — 2,200# (998 kg)
 - 50' (15.24 m) jib — 2,500# (1 134 kg)
- To determine capacities for intermediate boom lengths not shown on this chart, use the capacity for the next longer boom length shown — for actual angle or radius at which boom/load are being worked.
- These capacities apply only to the machine as originally manufactured and normally equipped by FMC Corporation, Construction Equipment Group.

UC-108B jib capacities

Boom—tubular; 42" x 42" (1.06 x 1.06 m) with open throat top section, retractable high gantry in raised position, 1 1/4" (32 mm) diameter boom pendants; boom live mast and boom midpoint suspension pendants as required.

Jib—tubular; 24" x 18" (0.61 x 0.46 m).

Counterweight—Upper cwt. "AB" 19,200# (8 709 kg).

GENERAL INFORMATION ONLY

*40' (12.19 m) jib at 30° off centerline of boom not recommended for booms over 130' (39.62 m).

**50' (15.24 m) jib at 30° off centerline of boom not recommended, and 50' (15.24 m) jib at 15° off centerline of boom not recommended for booms over 130' (39.62 m).

Notes — tubular jib capacities

- Capacities shown are maximum allowable.
- Use jib with 10' 0" (3.05 m) high jib mast in proper working position.
- To determine jib angle to ground, deduct jib angle to boom from the boom angle to ground.
- Jib backstay line is anchored to boom top section.
- Jib angle to boom must not exceed 30°.
- Determining machine jib capacities:
 - Add length of boom plus length of jib being used.
 - Determine jib load radius.
- Refer to lifting crane capacity chart and select boom length that corresponds to combined boom/jib length (6-a) and radius (6-b).
- Jib capacity is equal to the lifting crane capacity for the boom length (6-c) and radius (6-c)—unless restricted by the maximum jib capacities shown in above chart.
- If total boom/jib length (6-c) exceeds the longest boom length listed in lifting crane capacity chart, deduct 200# (91 kg) from the longest boom length shown for the required radius (6-b).
- Jib capacity is the resulting figure unless restricted by the maximum jib capacities shown in above chart.
- Refer also to Notes—lifting crane capacities.

UC-108B dragline/clamshell/magnet capacities

Refer to Notes below.

Boom—tubular, 42" x 42" (1.06 x 1.06 m) with open throat top section, retractable high gantry in raised position and 1 1/4" (32 mm) diameter boom pendants.

Carrier—FMC 8 x 4 drive, 126" (3.20 m) wheelbase, 11' 1" (3.38 m) wide.

Counterweight—Upper counterweight 'A' 13,000# (5 897 kg).

Length	Boom					Dragline		Clamshell/Magnet	
	Radius		Angle	Boom point height ^①

^①Measured from center of boom head sheave to ground — machine standing on tires.

GENERAL INFORMATION ONLY

Notes — dragline/clamshell/magnet capacities

- Capacities shown are maximum allowable, based on 360° swing, with machine standing level on firm supporting surface under ideal job conditions.
- Capacities are not more than 75% of minimum tipping loads for dragline; 68% for clamshell/magnet.
- Capacities are maximum recommended by Commercial Standard CS90-58 and PCSA Standard #1. User must make allowances for soft or uneven supporting surfaces, rapid cycle operations, bucket suction or other unfavorable conditions which may require smaller buckets or magnets for most efficient operation.
- Weight of bucket or magnet, plus load, should not exceed these capacities.
- Dragline operation with boom angle less than 35° is not recommended.
- Boom length for dragline/clamshell/magnet operation should not exceed 60' (18.29 m).
- Use of cwt. "AB" is not recommended for dragline, clamshell, or magnet service.
- Refer also to Notes — lifting crane capacities.
- These capacities apply only to the machine as originally manufactured and normally equipped by FMC Corporation, Construction Equipment Group.

We are constantly improving our products and therefore reserve the right to change designs and specifications.
